

Water to Fuel System
Generate Hydrogen fuel from
virtually any water source.

HYDROSYNE FUEL™ is a revolutionary technology that has cracked the inefficiency of converting regular water into hydrogen gas that is then consumed in a modified diesel engine or an unmodified natural gas turbine system. This is a “pre-processor/ fuel generation” technology that would work in front of and with Cummins equipment. This is not perpetual energy!! The water is consumed and there is an approximately a 5% parasitic load that is used to operate a genset.

1.5 megawatt modified 1800 hp Cummins
Diesel genset Located in Central America

50kw Ford motor in a genset
Located in Western United States

Hydrosyne is appropriate across a significant number of verticals:

Marine - Commercial

Marine - Residential

Pick Up Truck

Mining Equipment

Excavation Equipment

Trucking

Emergency Vehicles

Marine - Military

Generator
